The present invention relates to an apparatus and method for cleaning and pre-milking a teat of a milking animal. The method includes the steps of cleaning and pre-milking while establishing that milk is extracted, measuring a quality, comparing the measured quality with a reference and indicating whether the milk should be mixed with milk from another animal. The apparatus comprises devices enabling the method.

The cited D1, representing the closest prior art, reveals a method and device for foremilking cattle as well as cleaning their teats and testing the milk, see abstract.

D1 further describes separation of milk with disorder and this naturally implies a comparison value. I.e. there has to be something to compare with. This does not have to be foremilk, however, because it could be rinsing water or cleaning liquid, since D1 does not teach pre-milking sensing means for establishing that milk is in fact extracted from a teat.

The invention is novel, and, contrary to what is indicated in the search report, it is deemed to involve an inventive step. The invention is industrially applicable.
